Implementing Security Features and Governance/Administration Practices in Zoho Creator

Aim

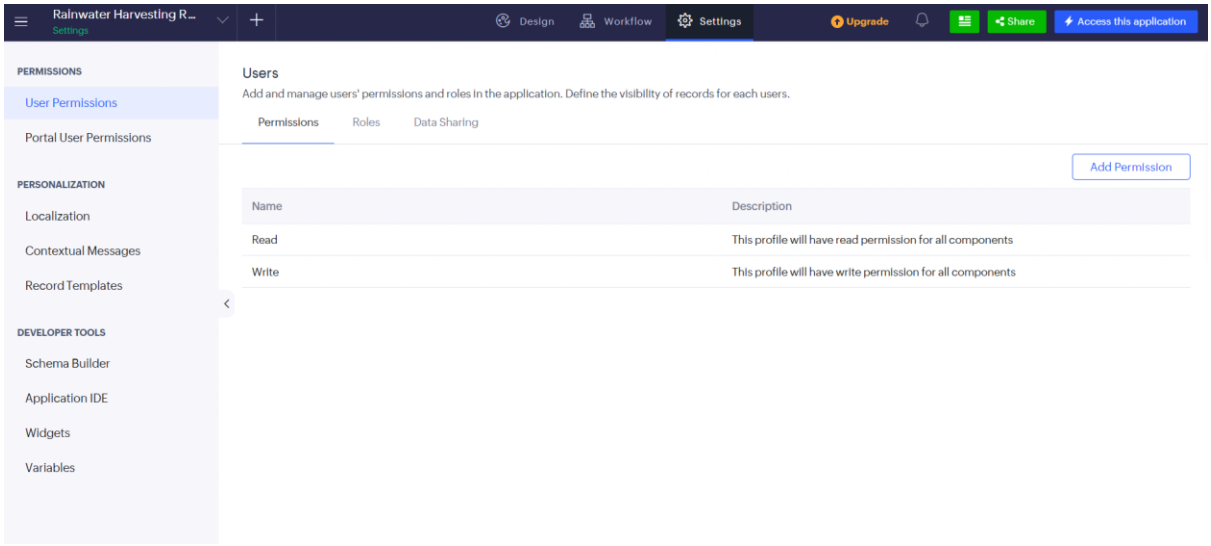

To implement security features and governance and administration practices in Zoho Creator to protect application data, control user access, maintain data integrity, and ensure secure management of the Rainwater Harvesting Record System.

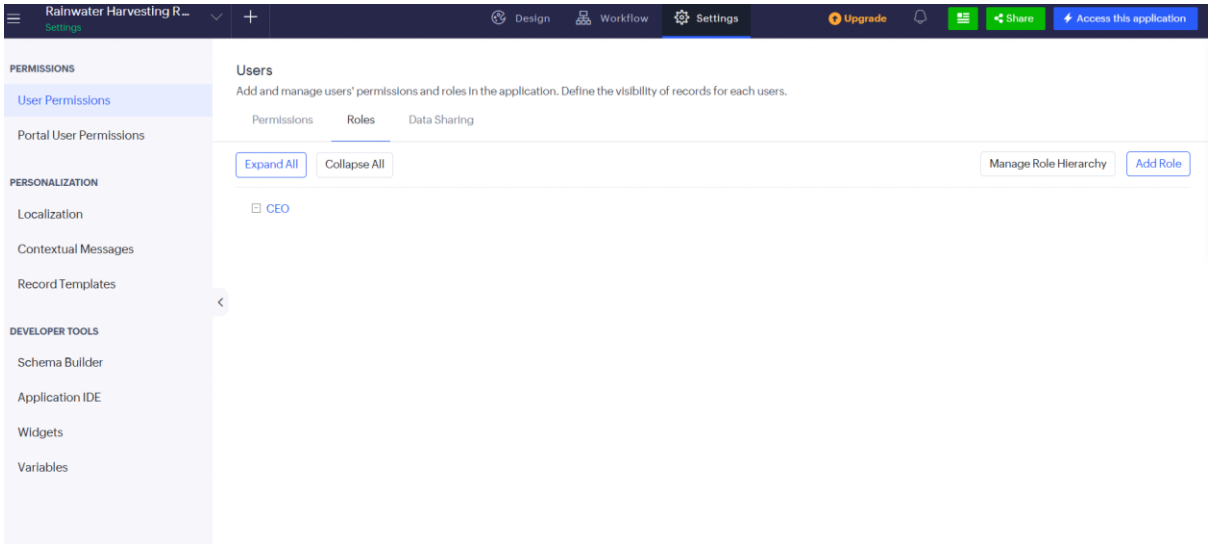

Procedure

1. Log in to Zoho Creator and open the Rainwater Harvesting Record System application.
2. Navigate to the application settings and explore the available security and user management options.
3. Open Settings → User Permissions and review the available roles and permissions.
4. Create or configure roles such as Admin and Viewer, if supported by the current application setup.
5. Assign suitable permissions to each role according to the user's responsibilities.
6. Configure access to forms, reports, and dashboards so that users can access only the features permitted for their roles.
7. Verify that required fields in the Rainfall Record, Storage Tank, and Water Usage forms are configured correctly to reduce invalid data entry.

8. Review the application-sharing and user-management settings to ensure that only authorized users can access the application.
9. Check the existing workflows and Deluge scripts to ensure that automated calculations and tank-level alerts work correctly.
10. Review the available data backup, export, and audit-related options to support data recovery and administrative monitoring.
11. Test the application using the configured permissions and verify that forms, reports, and dashboards behave as expected.

OUTPUT

Result

Security features and governance practices in Zoho Creator were explored for the Rainwater Harvesting Record System. User roles and permissions help control access to application features, while form validation and workflow testing help maintain data integrity. Application-sharing settings and available administrative options support secure application management.

Thus, the experiment demonstrates how security, access control, and administration practices can help protect application data and improve the reliability of a Zoho Creator application.
