Setting Up a Zoho Creator Account and Exploring the Platform Architecture and Interface

1. Aim

To create a Zoho Creator account, explore its platform architecture and user interface, and understand the basic components required to develop a low-code application for the Rainwater Harvesting Record System.

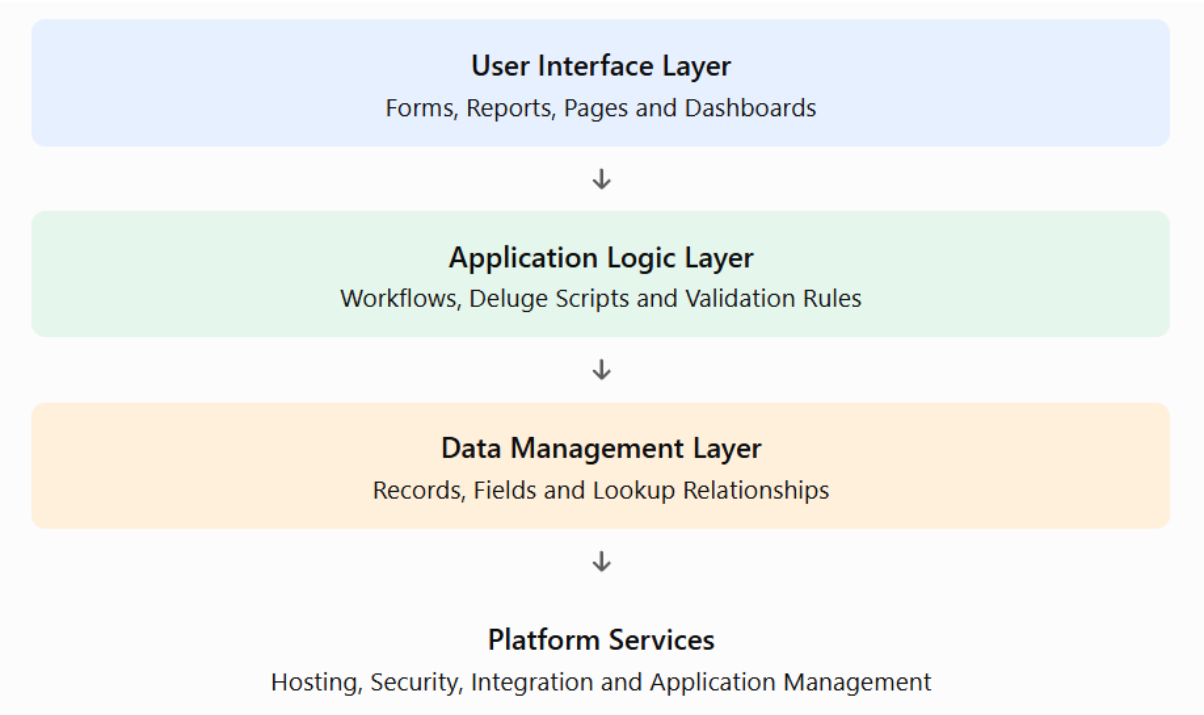

2. Procedure

1. Open the official Zoho Creator website: https://www.zoho.com/creator/
2. Sign up for a Zoho account or log in using an existing account.
3. Open the Zoho Creator application builder from the dashboard.
4. Explore the home page and identify the options available for creating, accessing, and managing applications.
5. Create a new application named Rainwater Harvesting Record System.
6. Explore the form builder and identify field types such as single-line text, number, date, dropdown, and lookup.
7. Examine the report builder to understand how application records can be displayed in list and summary formats.

8. Explore the page and dashboard-building options for presenting rainfall data, storage tank levels, and water usage statistics.
9. Examine workflows and Deluge scripting options to understand how calculations, automated alerts, and business rules can be implemented.
10. Explore application settings and access-control options to understand how application permissions and configurations are managed.

3. Platform Architecture

Zoho Creator follows a low-code architecture in which different application components work together.

4. Exploring the Interface

Component	Purpose
Home / Applications	Create and access applications
Form Builder	Design data-entry forms
Report Builder	Display and analyze records
Page Builder	Create customized application pages
Dashboard and Charts	Visualize application data
Workflow Builder	Automate tasks and actions
Deluge Editor	Add custom logic and calculations
Settings	Configure application options and permissions

5. Result

The Zoho Creator account was set up, and the platform interface and major components were explored. The application-building environment provided options for creating forms, reports, pages, dashboards, workflows, and custom scripts.

The platform architecture helped explain how the user interface, application logic, and data management components work together. These components form the foundation for developing the Rainwater Harvesting Record System, which records rainfall measurements, manages

storage tanks, tracks water consumption, and presents relevant information through reports and dashboards.

Thus, the experiment provided an understanding of the Zoho Creator environment and its role in low-code application development.
