## User and Role-Based Access Control in Zoho Creator

### Aim

To implement user and role-based access control in Zoho Creator to ensure that users can access application data and features according to their assigned roles and permissions in the Gym Membership Management System.

### Procedure

1. Log in to the Zoho Creator platform using valid credentials.
2. Open the existing Gym Membership Management System application.
3. Navigate to the Users or User Permissions section in the application settings.
4. Add the required users to the application by entering their email addresses and assigning appropriate roles.
5. Create roles such as Administrator, Gym Trainer, and Receptionist based on their responsibilities.
6. Assign permissions to each role according to the tasks they are allowed to perform.
7. Grant the Administrator permission to manage members, membership plans, payments, reports, and application settings.
8. Grant the Receptionist permission to register members, update membership details, and view payment status.

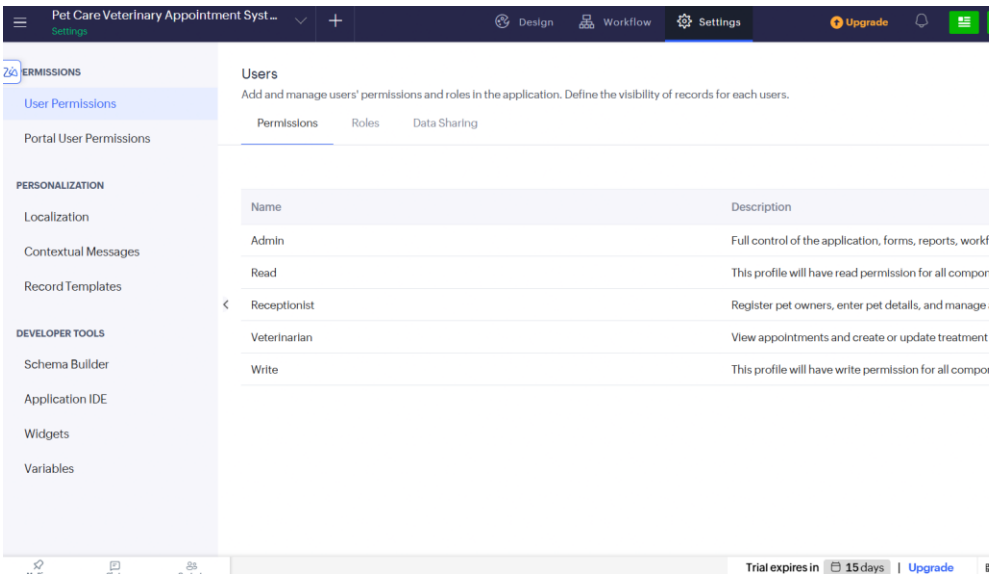

9. Grant the Gym Trainer permission to view relevant member information and membership status.
10. Configure access permissions for forms, reports, and pages to prevent unauthorized access to restricted information.
11. Save the permission settings and test the application by logging in with different user accounts.
12. Verify that each user can access only the features and records permitted by their assigned role.

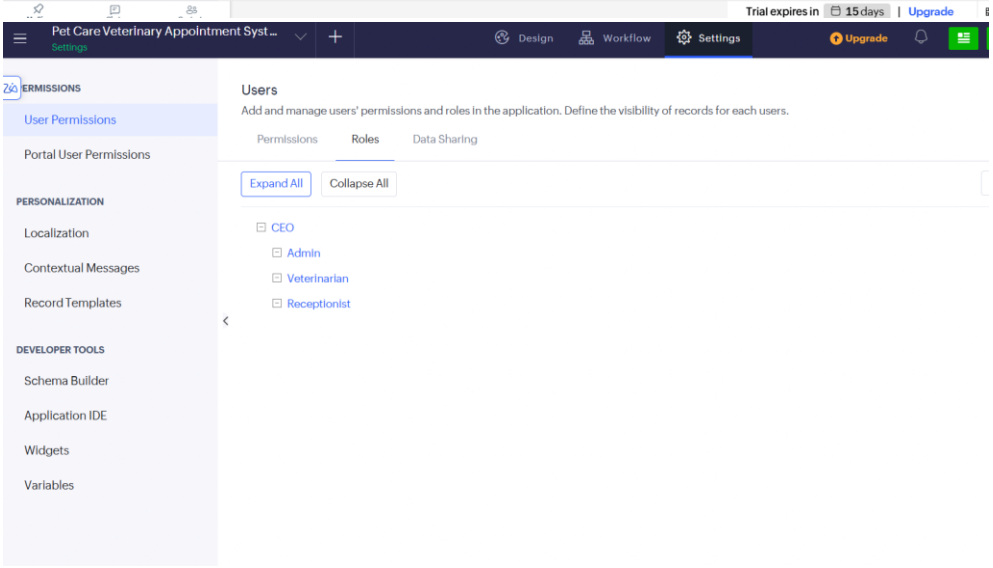

**Role and Permission Table**

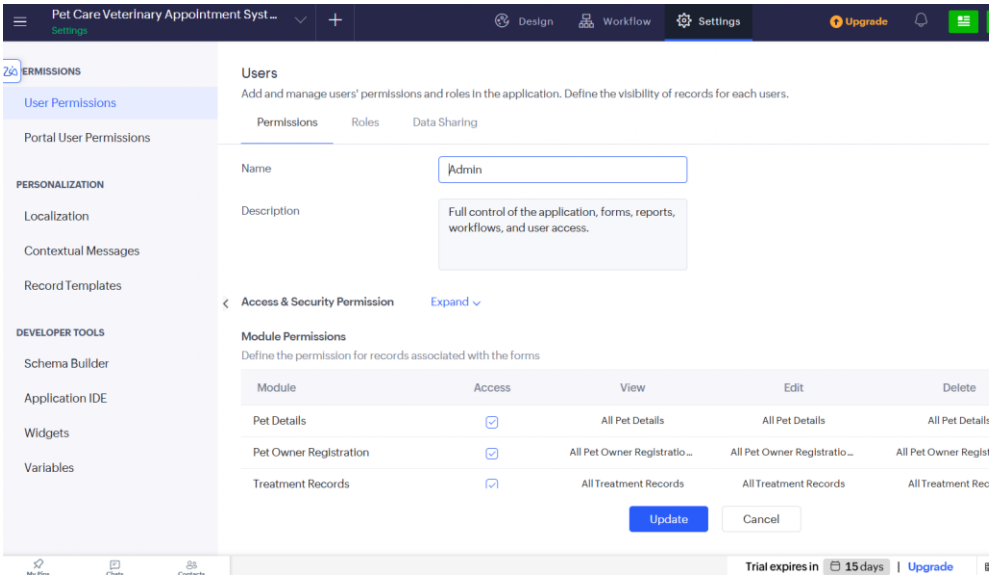

| **Role** | **Permissions** |
| --- | --- |
| Administrator | Manage all forms, records, reports, and users |
| Receptionist | Register members and manage membership details |
| Gym Trainer | View permitted member |

information and membership status

**Result**

Thus, user and role-based access control was configured in Zoho Creator for the Gym Membership Management System. Different roles were defined according to the responsibilities of users, and appropriate permissions were assigned to control access to forms, reports, and application features.

The Administrator was given management privileges, while the Receptionist and Gym Trainer were assigned limited permissions based on their duties. The access settings were tested to verify that users could access the permitted features.

Therefore, role-based access control improves data security, prevents unauthorized access, protects confidential membership information, and ensures that users can perform only the operations permitted by their assigned roles.
